Safety Pins

Products made of plastic and metal materials in various sizes to prevent unintentional opening of the strap clamp and to show that the product is not used before the end customer.

TECHNICAL SERVICES

Consultancy

Customer needs, whether from existing or potential clients, are assessed based on technical criteria, usability, and sectoral standards. After assessment, suitable products from our existing range are presented. If existing products do not meet requirements, technical development of customer-specific alternatives is undertaken and offered.

R&D studies are completed according to customer preferences; sample production and tests are conducted, and trial applications are carried out. Products approved by customers after evaluation are supplied accordingly.

TECHNICAL SERVICES

Product Design

Even if there is no direct request from current or potential customers, ongoing industry assessments are carried out as part of SILVERRING's R&D activities. New product designs are developed by modifying technical features of current products to meet diverse needs or facilitate industry application.

TECHNICAL SERVICES

Product Development

For products currently supplied to customers and used in their processes, R&D activities are conducted based on user experience, potential problems, and observations from SILVERRING's production and delivery processes.

Customer satisfaction, quality, cost, and sustainability are prioritized in these continuous improvement efforts.

TECHNICAL SERVICES

Testing

Criteria for all raw materials, semi-finished, and auxiliary materials used in our products have been established, and approved alternative suppliers identified. Test reports from suppliers are required to validate critical values defined by the SILVERRING technical team or customers, or tests are performed by SILVERRING and results recorded.

All products are tested according to industry standards and customer expectations during initial design, improvement, and mass production stages.

To ensure customer-specific criteria are met and tests are successful, R&D support, samples, logistics, technical documentation, and personnel assistance are provided.

KALİTE

Kalite Kontrol

Silverring;

Has established Quality Control processes that it attaches high importance within its organizational structure. Quality control activities, which are indispensable elements of the continuity of Customer Satisfaction, are handled within the framework of “PREVENTION” logic based on a proactive approach.

For customer-specific products; before the start of mass production activities, mutual agreement, testing and reporting processes are carried out, the characteristics of the product are determined to cover all the expected functions of the product and the Sample Production stage is started.

The produced samples are checked according to the acceptance criteria with real applications. In this way, it is aimed to prevent the customer from experiencing problems during the use of our products. In case of agreement on the outputs obtained, customer approval is obtained. In the products that are put into mass production; according to the instructions defined in our Quality Management Systems, controls are carried out and recorded at every stage by applying Technical Control Criteria.

Feedback from our customers about the shipped products is classified and recorded. Necessary evaluations are made and Root-Cause research is conducted. According to the data obtained as a result of the examinations, the source of the problem is determined and solution suggestions are produced. At these stages, detailed reports are made to our customers. Corrective-Preventive Actions determined by mutual agreement are carried out, their effectiveness is checked and approved.

Our quality control activities cover all of our raw material and semi-finished input control, production stages, stocking, packaging and shipment processes.
